	Urgent	Not urgent
Important	• Log exercises with the weight, sets, and reps I did. • Save workouts by date so I can look back at previous sessions. • Manually log food and track daily calories, protein, carbs, and fat. • Edit or delete entries if I enter something wrong.	• Add graphs to show changes in lifting performance and nutrition over time. • Let users set calorie, protein, and workout goals. • Save workout routines so I don't have to enter the same exercises every time. • Add a food database or barcode scanner to make logging meals faster.
Not Important	• Use a date picker library to select workout and meal dates. • Use a UI component library for buttons, forms, and menus. • Use an existing storage library to save and load entries between sessions.	• A social feed for sharing workouts and meals. • Leaderboards for comparing how much people lift. • Custom profiles/avatars
